

<<<CORPORATE IT SERVICE DESK>>>

Jira Service Management Portfolio Case Study

SIMULATED ENTERPRISE IT SUPPORT ENVIRONMENT

PROJECT OBJECTIVE

Design and configure a realistic corporate IT service desk that demonstrates how Jira Service Management can be used to manage employee incidents, service requests, priorities, workflows, automation, SLAs, and operational reporting.

THE SERVICE DESK LIFECYCLE

Employee Request

Triage & Prioritization

Queue & Assignment

Investigation / Fulfillment

Customer Communication

Resolution

SLA & Operational Reporting

CORE CAPABILITIES

- Incident Management
- Service Request Management
- Workflow Design
- Queue Management
- Automation
- SLA Management
- Employee Onboarding
- Dashboard & Reporting
- Knowledge Base Investigation

BUSINESS PROBLEM

Corporate IT support teams need a consistent way to manage employee technology issues and service requests.

Without a structured service desk, requests can become difficult to prioritize, assign, track, and measure.

This project was designed to demonstrate a centralized IT support environment where:

- Requests are categorized and prioritized
- Support work is organized through operational queues

- Ownership and status are visible
- High-priority work receives automated attention
- Response and resolution targets are measurable
- Completed work can be analyzed through dashboards and reports

SOLUTION DESIGN

The service desk was structured around a complete IT support lifecycle:

Employee Request

Triage & Prioritization

Queue & Assignment

Investigation / Fulfillment

Customer Communication

Resolution

SLA & Operational Reporting

The Jira Service Management environment was configured to support this lifecycle through dedicated workflows, queues, SLAs, automation, service requests, and reporting.

WORKFLOW DESIGN

The IT Help and Service Request workflow supports operational states including:

- Waiting for Support
- In Progress
- Waiting for Customer
- Pending
- Escalated
- Resolved
- Closed
- Canceled

Priority High

DEMO: Service Request Fulfilment workflow for Jira Service Management

Close

AUTOMATION

A High Priority Escalation automation was configured to reinforce priority handling within the service desk.

Trigger: Work item transitions to In Progress

Condition: Priority = High

Action:

Automatically add an internal escalation comment reminding the support team to prioritize the request and monitor the applicable SLA target.

VALIDATION

The automation was successfully tested using DEMO-26.

The resulting internal automation comment was verified directly on the work item, demonstrating that the configured rule executed successfully.

Figure: High Priority Escalation automation successfully executed on DEMO-26.

SLA MANAGEMENT

Service Level Agreements were configured to establish measurable response and resolution targets for the service desk.

Configured targets:

- Time to First Response
 - Highest priority: 2 hours
 - Other work items: 8 hours
- Time to Resolution
 - Highest priority: 4 hours
 - Other work items: 16 hours

The SLAs use the configured Sample 9-5 Calendar and measure work from request creation through the applicable response or resolution condition.

SLA monitoring was also incorporated into operational queues and reporting to provide visibility into requests approaching or exceeding service targets.

REPORTING RESULTS

The service desk reporting environment includes SLA success-rate and SLA met-versus-breached reports.

During portfolio capture:

- SLA Success Rate - 66.7% for Time to First Response
- SLA Success Rate - 66.7% for Time to Resolution

- SLA Met - 16
- SLA Breached - 8

These figures represent the simulated project dataset and demonstrate how Jira Service Management can provide measurable service-performance visibility.

Figure: Time to first response SLA configuration.

QUEUE AND OPERATIONAL MANAGEMENT

Dedicated queues were configured to organize support work according to operational needs.

Examples include:

- High Priority Incidents
- My Open Requests
- Waiting for Customer
- Hardware & Device Issues
- Account & Access Requests
- Recently Resolved Requests
- SLA At Risk

The queues provide focused operational views for prioritization, ownership, customer follow-up, resolution tracking, and SLA monitoring.

The Recently Resolved Requests queue demonstrated the ability to maintain a dedicated view of completed service work, while the SLA At Risk queue was designed to surface active requests approaching their resolution threshold.

INCIDENT MANAGEMENT

The service desk was populated with realistic corporate IT incidents to demonstrate the complete support lifecycle.

Example incidents included:

- Wi-Fi connectivity failure
- Email account login failure
- VPN connection unavailable
- Laptop performance issue
- Teams microphone failure
- Network drive unavailable
- Office printer unavailable

Each incident was treated as a support work item with a defined priority, assignment, status progression, troubleshooting documentation, customer communication, SLA tracking, and resolution.

CASE EXAMPLE - DEMO - 7

DEMO-7 - Unable to connect to company Wi-Fi

The request was assigned, investigated, progressed through the support workflow, and resolved.

The resolution documentation recorded the troubleshooting performed and confirmed restored network connectivity and access to required company resources.

This demonstrates how a support technician can document both the technical resolution and the customer-facing outcome within the service desk.

Figure: Resolved Wi-Fi incident demonstrating ticket lifecycle, SLA information, priority, assignment, and resolution documentation.

Figure: Internal troubleshooting and resolution notes documented on the incident.

EMPLOYEE ONBOARDING

The project also demonstrates fulfillment of a multi-step employee service request.
DEMO-20 - New employee IT onboarding

The onboarding request was structured as a parent work item with four subtasks:

- DEMO-21 - Create user account
- DEMO-22 - Configure company laptop
- DEMO-23 - Provision email and application access
- DEMO-24 - Configure shared-drive permissions

All four subtasks were completed, and the parent request was resolved after the onboarding workflow was completed and verified.

This demonstrates how Jira Service Management can be used to coordinate multiple IT fulfillment activities under a single employee request.

Figure: Employee onboarding request with four completed IT fulfillment subtasks.

The screenshot displays the Jira Service Management interface for a request titled "New employee IT onboarding" (ID: DEMO-20). The request is marked as "Resolved" and "Done". The description states: "A new employee is joining the company and requires standard IT setup before their start date. Please prepare the required user account, company email access, standard business applications, shared-drive permissions, and laptop configuration so the employee can begin work on their first day." The "Subtasks" section shows four completed tasks, all assigned to Youssef Elka... with a status of "Done":

Work	Priority	St...	Assignee	Status
DEMO-21 Create user account	Medium		Youssef Elka...	Done
DEMO-22 Configure company laptop	Medium		Youssef Elka...	Done
DEMO-23 Provision email and application access	Medium		Youssef Elka...	Done
DEMO-24 Configure shared-drive permissions	Medium		Youssef Elka...	Done

The "Activity" section shows a recent internal note and a reply to the customer. The right sidebar provides additional details, including SLAs (Time to first response within 8h, Time to resolution within 16h), the assignee (Youssef Elka...), and the reporter (Youssef Elka...). The overall progress bar indicates 100% completion.

DASHBOARD AND OPERATIONAL REPORTING

A custom dashboard named Corporate IT Service Desk Dashboard was created to provide an operational view of the simulated service desk.

The dashboard includes:

- High-priority active requests
- Assignee workload
- Priority distribution
- Average request age
- Resolution-time reporting

The service space also provides additional operational reports covering SLA performance and request resolution.

The dashboard demonstrates how service-desk data can be converted into operational visibility for workload management and service-performance monitoring.

Figure: Corporate IT Service Desk Dashboard showing active high-priority work and assignee workload.

Figure: Priority distribution across the simulated service desk.

Figure: Average age of service requests over the reporting period.

KNOWLEDGE BASE

The Jira Service Management Knowledge Base was evaluated as part of the project to support self-service troubleshooting and faster request resolution.

The environment provided a Knowledge Base area with troubleshooting and how-to article templates. An attempt was made to create and configure Knowledge Base content. However, the Jira environment returned an article-creation error and available Confluence permissions prevented additional content from being created.

The limitation was documented rather than presenting the Knowledge Base as fully implemented.

This demonstrates an important operational practice: distinguishing between functionality that was successfully configured and functionality that was investigated but limited by the available environment.

Figure: Knowledge Base environment and article-creation limitation encountered during testing.

PROJECT RESULTS

The completed simulated service desk demonstrates an end-to-end IT support operating model within Jira Service Management.

The project successfully demonstrates:

- Incident and service request management
- Structured workflow and status management
- Priority-based operational queues
- SLA configuration and monitoring
- High-priority escalation automation
- Multi-step employee onboarding
- Internal troubleshooting documentation
- Customer communication
- Dashboard and operational reporting
- Knowledge Base investigation

The automation was successfully validated through DEMO-26, while the onboarding workflow was demonstrated through DEMO-20 and its completed subtasks.

The resulting environment provides a practical demonstration of how Jira Service Management can support day-to-day corporate IT operations.

FINAL SUMMARY

Corporate IT Service Desk - Jira Service Management demonstrates a complete simulated IT support environment built from the ground up.

The project combines service-desk operations, workflow design, queue management, SLA management, automation, employee onboarding, incident documentation, and operational reporting into one integrated environment.
